

Product Carbon Footprint Summary

Issued August 2012

GLOBAL WARMING AND PRODUCT CARBON FOOTPRINTING

Tesco recognises that global warming is a critical environmental issue. The vast majority of scientists agree that the emission of greenhouse gases from human activities (such as burning fossil fuels in our homes, vehicles and industries) are causing global warming, which is causing negative consequences both today and for future generations.

If we don't act, the expected increase in global temperature is likely to:

- increase the occurrence of extreme weather events;
- have strong, negative impacts on planetary ecosystems – food, water and health; and
- could trigger irreversible changes in the climate system.

As a responsible business we are committed to reducing our own emission of greenhouse gases, and we are committed to working with our suppliers and customers to help them reduce theirs. To reduce the greenhouse gas impact of the products we sell, we must first understand how the production, distribution, retailing and use of our products results in these emissions which contribute to global warming.

One way to understand, and measure, the environmental impact of our products is to calculate their "carbon footprint". Tesco was one of the first retailers to adopt product carbon footprinting and, although it is still a relatively new approach and the science is still emerging, we believe it provides an important evidence base so that we can understand the impact our products have and target the greatest reduction opportunities.

Over the last five years, we have footprinted over 1,100 Tesco (own brand) products. Understanding the carbon footprints of these products has enabled us not only to reduce the direct impact of our business on the environment, but also to provide advice to suppliers on how they can become more resource efficient, and to advise customers on how they can reduce their household carbon footprint and save money on energy use at home.

What is a product's carbon footprint?

A product's carbon footprint is a measure of a product's contribution to global warming through the emission of greenhouse gases. It measures the emission of greenhouse gases from each phase of a product's life-cycle – from agriculture, through processing and packaging, distribution, retailing, use and disposal.

The carbon footprint is calculated by measuring the emissions of six gases which predominantly contribute to global warming:

Greenhouse gas	Common sources
Carbon Dioxide	Fossil fuel combustion, forest clearing, cement production
Methane	Landfill, production and distribution of natural gas and petroleum, fermentation from the digestive system of livestock, rice cultivation, fossil fuel combustion
Nitrous Oxide	Fossil fuel combustion, fertilizers, nylon production, manure
Hydro Fluorocarbons	Refrigeration gases, aluminium smelting, semiconductor manufacturing
Per Fluorocarbons	Aluminium production, semiconductor industry
Sulphur Hexafluoride	Electrical transmissions and distribution systems, circuit breakers, magnesium production

The carbon footprint measures both the direct and the indirect emission of these greenhouse gases throughout a product's life:

- direct emissions arise from the leakage of greenhouse gases or from chemical processes in the cultivation and manufacturing of products; and
- indirect emissions arise, for instance, from coal-fired power stations to generate the electricity necessary to manufacture the product, or to light and heat the supermarket, or that is used at home to cook the product.

To express a product's carbon footprint as a single number (a common currency), the emissions of these six greenhouse gases are converted into an equivalent amount of carbon dioxide (CO₂ equivalent or CO₂e). This conversion is based on the relative global warming impact of each gas, and the final carbon footprint is expressed as the weight of carbon dioxide.

As a simple example, if the processing of a product uses 3 kWh of electricity and its distribution consumes 0.1 litres of diesel, then the carbon footprint for these life-cycle stages would be:

	Used		CO ₂ e emission factor ¹		Carbon footprint (kg CO ₂ e)
Processing	3 kWh	x	0.49390 per kWh	=	1.48 kg CO ₂ e
Distribution	0.1 litres	x	3.1672 per litre	=	0.32 kg CO ₂ e
Total carbon footprint					1.80 kg CO₂e

This means that the processing and distribution of this product had resulted in the emission of 1.80 kg CO₂e (this weight of CO₂ is equal to 0.92 m³ of CO₂).

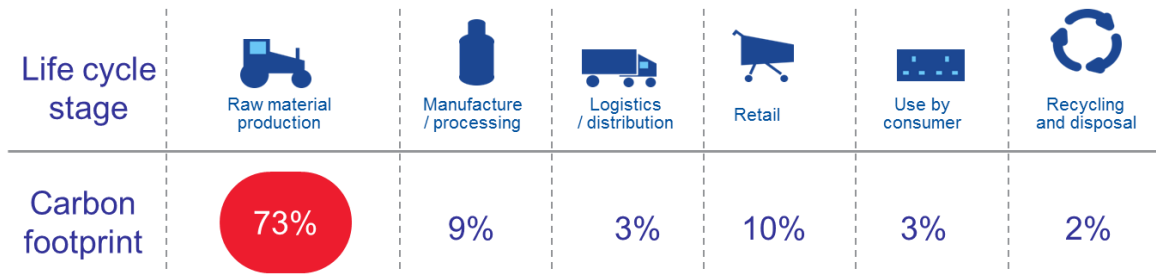

To measure the full impact of a product, we measure greenhouse gas emissions across its full life-cycle, from 'cradle to grave'. This includes emissions from the extraction of raw materials, direct gas emissions during the agricultural and processing stages, waste outputs, use of packaging materials, fuel consumption in distribution, energy consumption in processing, retail and product use (by customers), and disposal at end-of-life.

For example, in a typical 420g can of Tesco's baked beans, the energy used to cook the beans during manufacture contributes 30g CO₂e, and a further 120g CO₂e comes from the energy and raw materials used to make the tin can.

¹ Greenhouse gas conversion factors are published by Department for Environment Food and Rural Affairs: [2012 greenhouse gas conversion factors for company reporting](#)

Adding these together all of the greenhouse gas emissions gives the total carbon footprint for a product. For example, in milk we have learnt that 73% of the carbon footprint comes from dairy farming – largely the result of cows burping methane and the use of nitrogen-based fertilizers.

What products have we footprinted and why?

We have footprinted a large number of our own brand products across the store focusing on many of the products our customers buy every week, such as bread, milk, fruit and vegetables, together with some items that are known to be energy intensive, such as light bulbs.

The list below is the output of our footprinting work, and gives the carbon footprint of each product (for a given quantity of the product), enabling you to compare different products.

Some of our product carbon footprints have been certified by the Carbon Trust, an independent advisory service. They verify that the carbon footprints have been correctly calculated, and this enables us to use their carbon footprint label on these products for a period of time.

To read the table, follow each row to find out the carbon footprint information for the product.

HOW ARE WE REDUCING OUR CONTRIBUTION TO GLOBAL WARMING

What is Tesco doing to reduce carbon emissions?

Tesco is committed to leading on the issue of global climate change, and has set itself three strategic carbon reduction targets:

- to become a zero-carbon business by 2050;
- to reduce the emissions of the products we sell by 30% by 2020; and
- to help our customers to reduce their carbon footprint by 50% by 2020.

Tesco is actively working to reduce carbon emissions in our stores, distribution network and in our supply chain because we believe it is the right thing to do for a responsible business seeking sustainable profits. For instance, we have invested to make significant use of railway transport across the UK instead of lorries, saving 15 million kg of CO₂e each year, and we have converted the fridges in 100 stores to work on natural refrigerants (rather than fluorocarbons) so that any leakages have a much lower impact on global warming.

To find out more about our carbon reduction targets and our plans to achieve them, read our most recent [Corporate Responsibility Review](#) on the [Tesco plc website](#).

How can you reduce your carbon footprint?

In the product list below you will find some hints and tips on how to reduce your carbon impact when using our products. You can find more advice here:

- The Carbon Trust (www.carbontrust.com/home) is an independent advisory service supporting green development
- Love Food, Hate Waste (www.lovefoodhatewaste.com) offers hints and tips about making the most of the food you buy

LIMITATIONS

Primary data for calculating product carbon footprints were collected from Tesco suppliers and are considered to be of reasonable quality. In general, sound secondary life cycle data were sourced in order to translate the primary input/output data from the suppliers into greenhouse gas emissions. On occasions, substitute data were also used from one supplier to inform a data gap for another. Such assumptions were only made where it was considered reasonable and representative to do so. Given the reasonable quality of primary data and the nature of assumptions, we have a relatively high degree of confidence that the findings are representative. However, there will always be a degree of uncertainty associated with these results.

While every care has been taken to ensure this information is correct, products are constantly being reformulated and ingredients lists altered, which will affect the carbon footprint. We would therefore recommend that you treat this list as an indicative guide. The information given in this list applies to Tesco own-label goods only, and no branded goods are included in this list.
